

A little more scale...

The Scientific Method

Naked Eye Observations: the Appearance of the Sky

Scientific Notation

- $10^0 = 1$
- $10^1 = 10$
- $10^2 = 100$
- •
- $10^6 = 1,000,000$
- similarly...
- $10^{-1} = 0.1$
- $10^{-6} = 0.000001$

Units important!

1 g cm⁻³ = 1,000 kg m⁻³ density of water

5.5 g cm⁻³ average density of the Earth

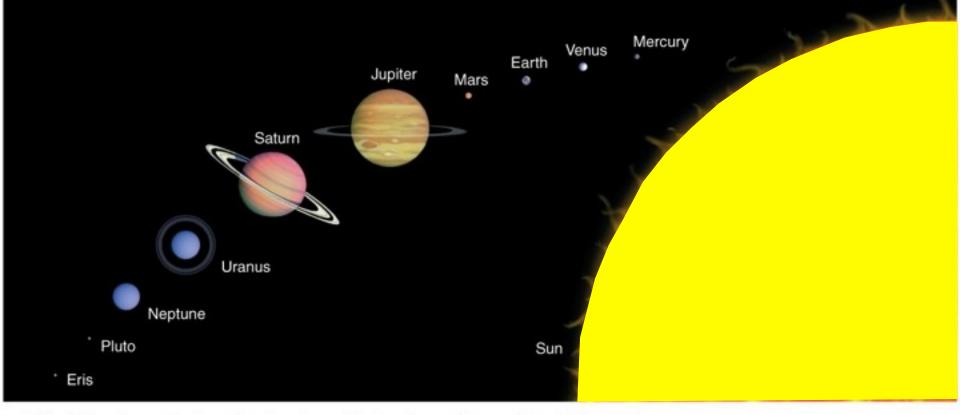

10⁻²⁹ cm⁻³ approximate average density of the universe

Definition: Light-Year

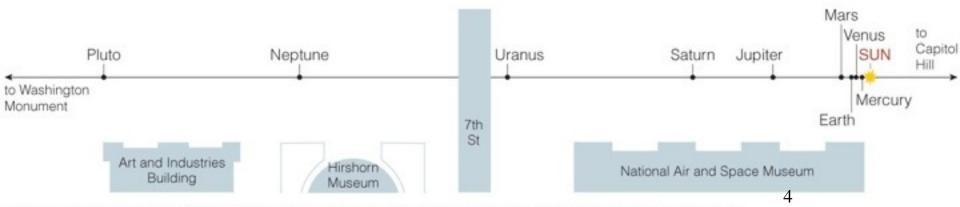

- The **distance** light can travel in one year.
- About 10 trillion kilometers (6 trillion miles). (10¹³ km)

$$d = c \times t$$

distance = (speed of light) x (travel time)

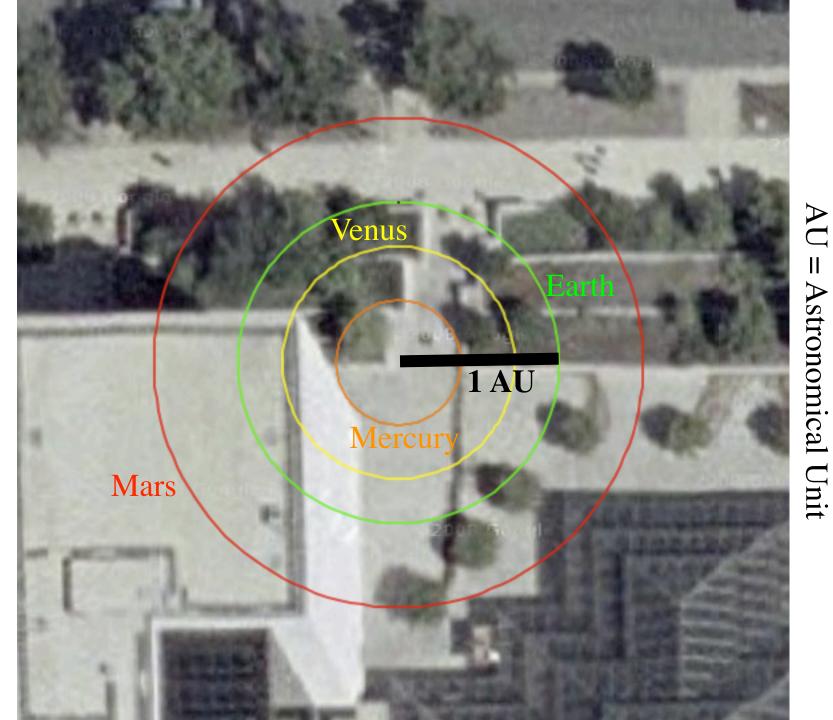

a This painting shows the Sun, the planets, and the two largest known "dwarf planets." (Distances are not to scale in this painting.)

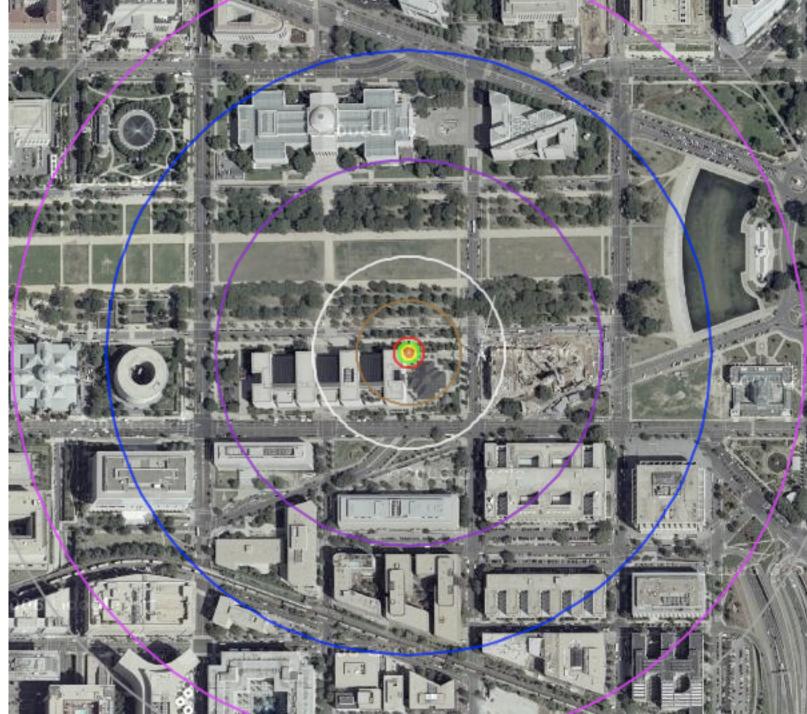

b This map shows the locations of the Sun and planets in the Voyage model; the distance from the Sun to Pluto is about 600 meters (1/3 mile). Planets are lined up in the model, but in reality each planet

The sun is 13 cm in diameter on this scale

To same scale

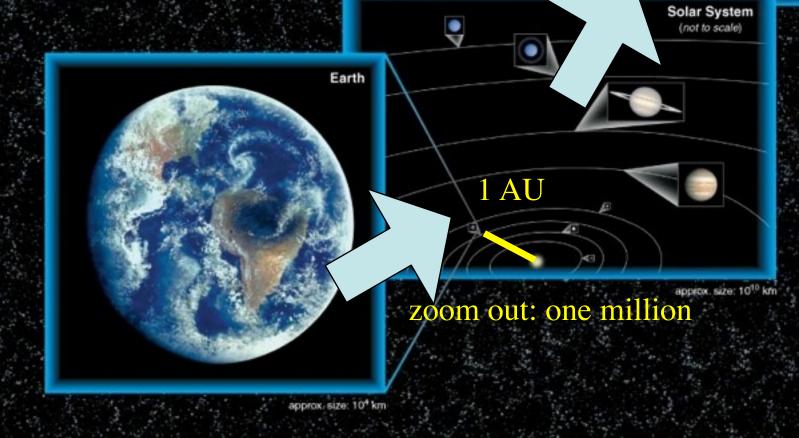

Pluto 40 AU

One light year is about 63,000 AU

26,000 light-years

approx: size: 1018 km

zoom out: one hundred million

From the sun to the center of the Milky Way Galaxy is about 26,000 light-years 230-million-year orbi

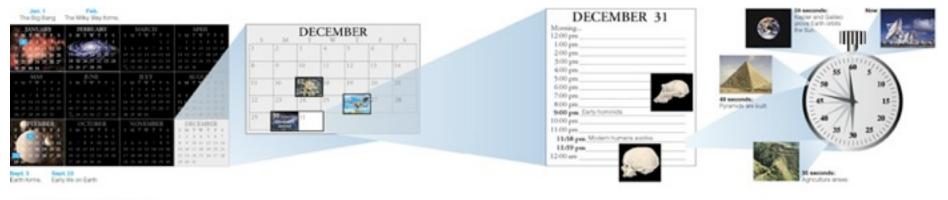

28,000

light-years

The difference from 28,000 light-years reflects the uncertainty in this measurement.

The Universe is Ancient

• The Cosmic Calendar: A scale on which we compress the history of the universe into 1 year.

E 2017 Prayon Education, Inc., pathology as Addron Wollow

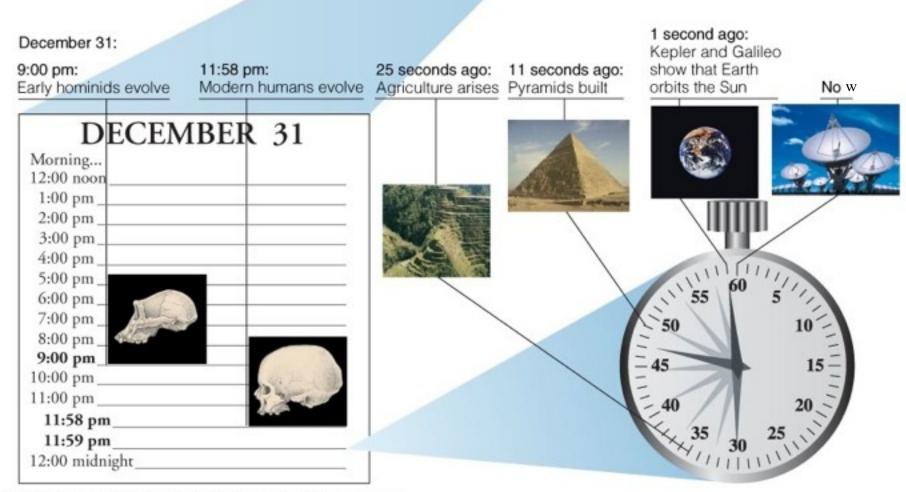

The Universe is about 14 billion years old, so at this scale, 1 month represents a little more than 1 billion years.

Astronomy covers, well, astronomical scales:

- The Universe is MUCH larger than
 - Galaxies which are MUCH larger than
 - Stars which are MUCH larger than
 - Planets which are MUCH larger than
 - » Moons, comets, and asteroids, which are MUCH larger than
 - PEOPLE
- The Universe is incredibly ancient

– but does have a finite age

<u>The Scientific Method</u> A few necessary ASSUMPTIONS:

- There exists an objective, knowable Reality
 - or at least an inter-subjective reality upon which independent observers can agree
- Reality is governed by physical processes that can be described by a set of rules
 The "Laws of Nature"
- The Laws of Nature are accessible to human knowledge through experimentation
- The Laws of Nature are universal
 - The rules don't change arbitrarily
 - God doesn't cheat

The idealized scientific method:

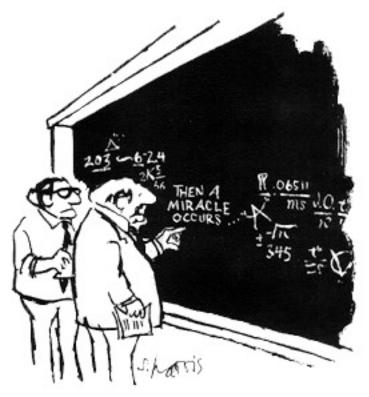

- Based on proposing and testing hypotheses
- **hypothesis** = educated guess

(text, chapter 3.9)

Hallmarks of Science: #1

Modern science seeks explanations for observed phenomena that rely solely on natural causes.

(A scientific model cannot include divine intervention.)

"I think you should be more explicit here in step two."

Hallmarks of Science: #2

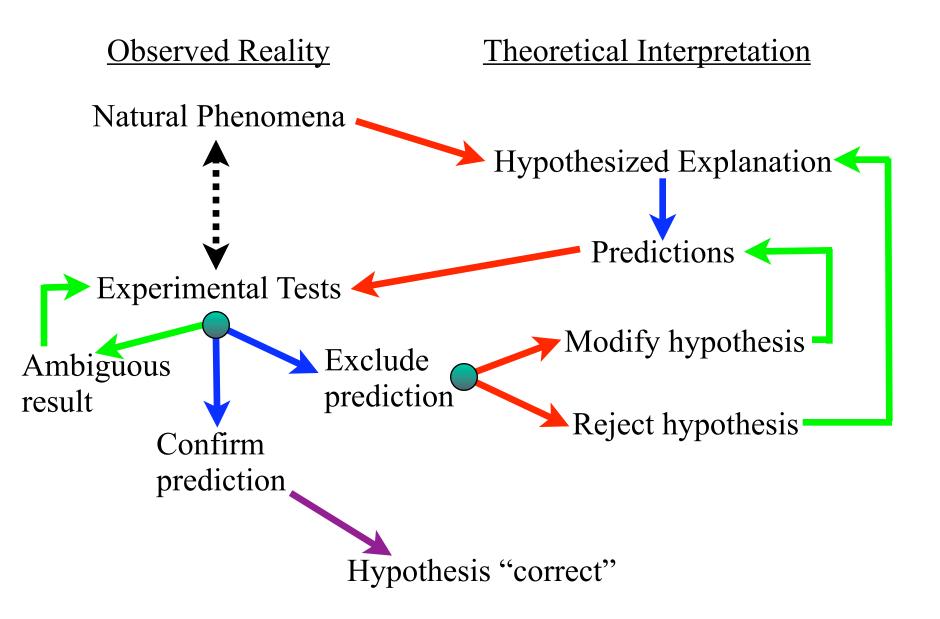

Science progresses through the creation and testing of models of nature that explain the observations as simply as possible.

> This philosophy of simplicity is often called "Occam's razor"

Hallmarks of Science: #3

A scientific model must make testable predictions about natural phenomena that would force us to revise or abandon the model if the predictions do not agree with observations.

Hypothesis Testing

The Principle of Doubt

- Hypotheses can be *rejected* but never completely *confirmed*.
- At best, a theory can be *adequate* for describing a specific set of phenomena.
- Do not trust verify through experiment.
- Simple theories are preferable to complicated theories (Occam's Razor)
 - Any theory can be made complicated enough to explain anything
 - Elegance and Understanding trump Age and Authority
 - If a theory has its predictions come true, we are obliged to acknowledge its efficacy, even if it means rejecting something we formerly believed.

Measurement Uncertainty

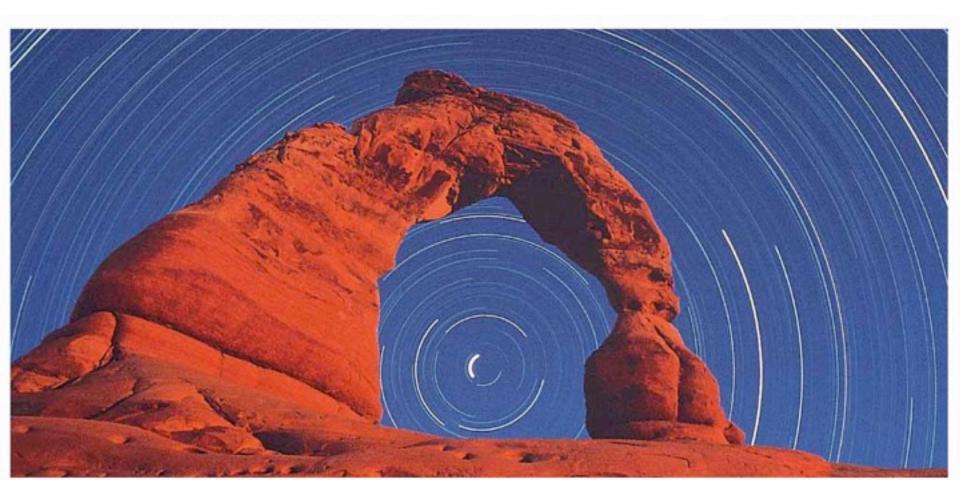

- No experiment is perfect
- Experimental uncertainty is often the difference between rejecting a hypothesis and an ambiguous result
- It is important to quantify both measurements AND their accuracy
 - e.g., Newton's constant:

 $G = (6.67428 \pm 0.00067) \times 10^{-11} \text{ m}^3 \text{ kg}^{-1} \text{ s}^{-2}.$ (0.01%)

the distance to the center of the Milky Way

 $R_0 = 26,000 \pm 2,000$ light years (8%)

The Appearance of the Sky

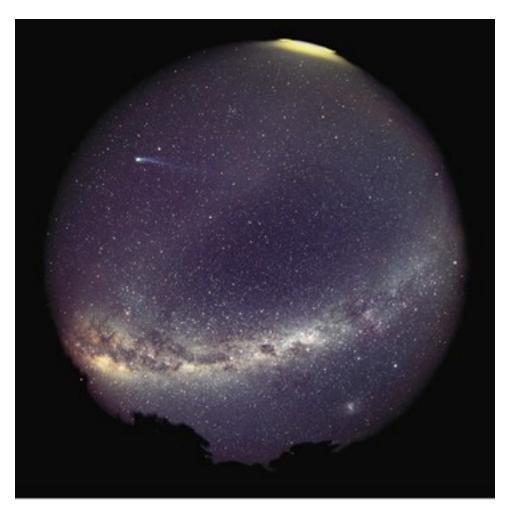

2.1 Patterns in the Night Sky

Our goals for learning:

- What does the universe look like from Earth?
- Why do stars rise and set?
- Why do the constellations we see depend on latitude and time of year?

What does the universe look like from Earth?

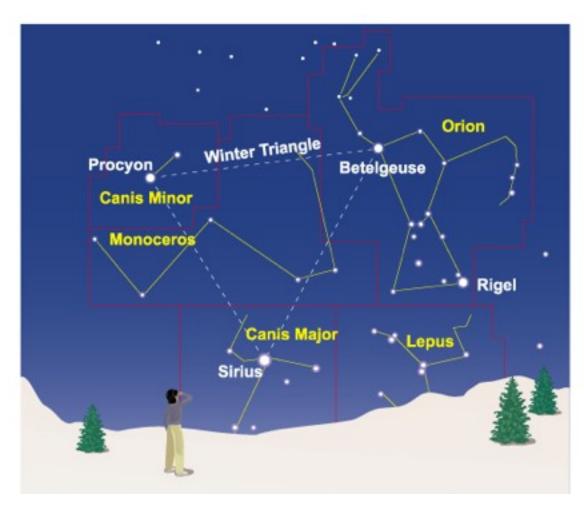

With the naked eye, we can see more than 2,000 stars as well as the Milky Way.

Constellations

A constellation is a *region* of the sky.

88 constellations fill the entire sky.

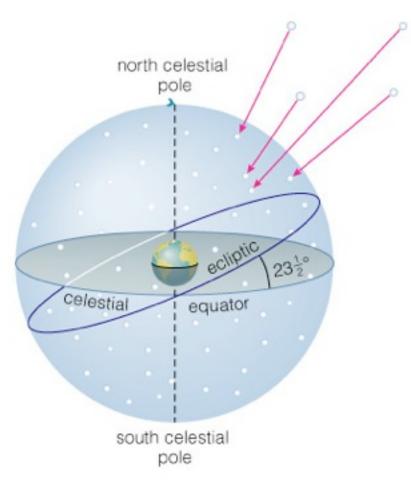

Thought Question

The brightest stars in a constellation...

- all belong to the same star cluster.
- all lie at about the same distance from Earth.
- may actually be quite far away from each other.

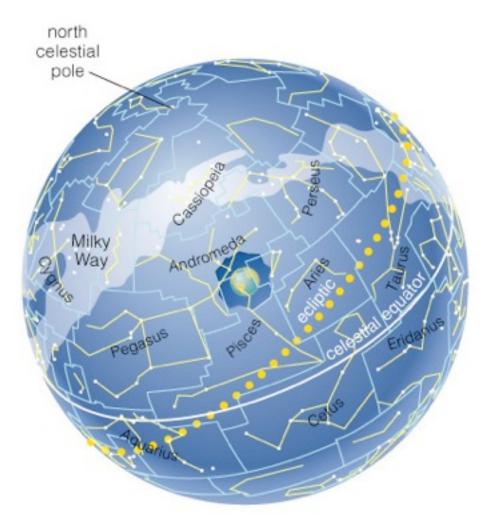

The Celestial Sphere

Stars at different distances all appear to lie on the celestial sphere.

The ecliptic is the Sun's apparent path through the celestial sphere.

The Celestial Sphere

The 88 official constellations cover the celestial sphere.

The celestial sphere is like a globe of the earth the 2D surface of a sphere that maps where things are.

BUT we look up at it from the inside rather than down on it from above. East & West get flipped like left and right in a mirror.
