A little more scale...

The Scientific Method

Naked Eye Observations:  
the Appearance of the Sky

# Definition: **Light-Year**

- The **distance** light can travel in one year.
- About 10 trillion kilometers (6 trillion miles).  
( $10^{13}$  km)

$$d = c \times t$$

distance = (speed of light) x (travel time)

## Light travel time & distance

- Light travels at a finite speed (300,000 km/s).

<b>Destination</b>	<b>Light travel time</b>
Moon	1 second
Sun	8 minutes
Sirius	8 years
Andromeda Galaxy	2.5 million years

- Thus, we see objects as they were in the past:

*The farther away we look in distance,  
the further back we look in time.*

Diameters to scale  
but not distances

Distances to scale:

Smithsonian Institution on the National Mall in Washington, DC

The sun is 13 cm in diameter on this scale

AU = Astronomical Unit

Smithsonian Institution on the National Mall in Washington, DC

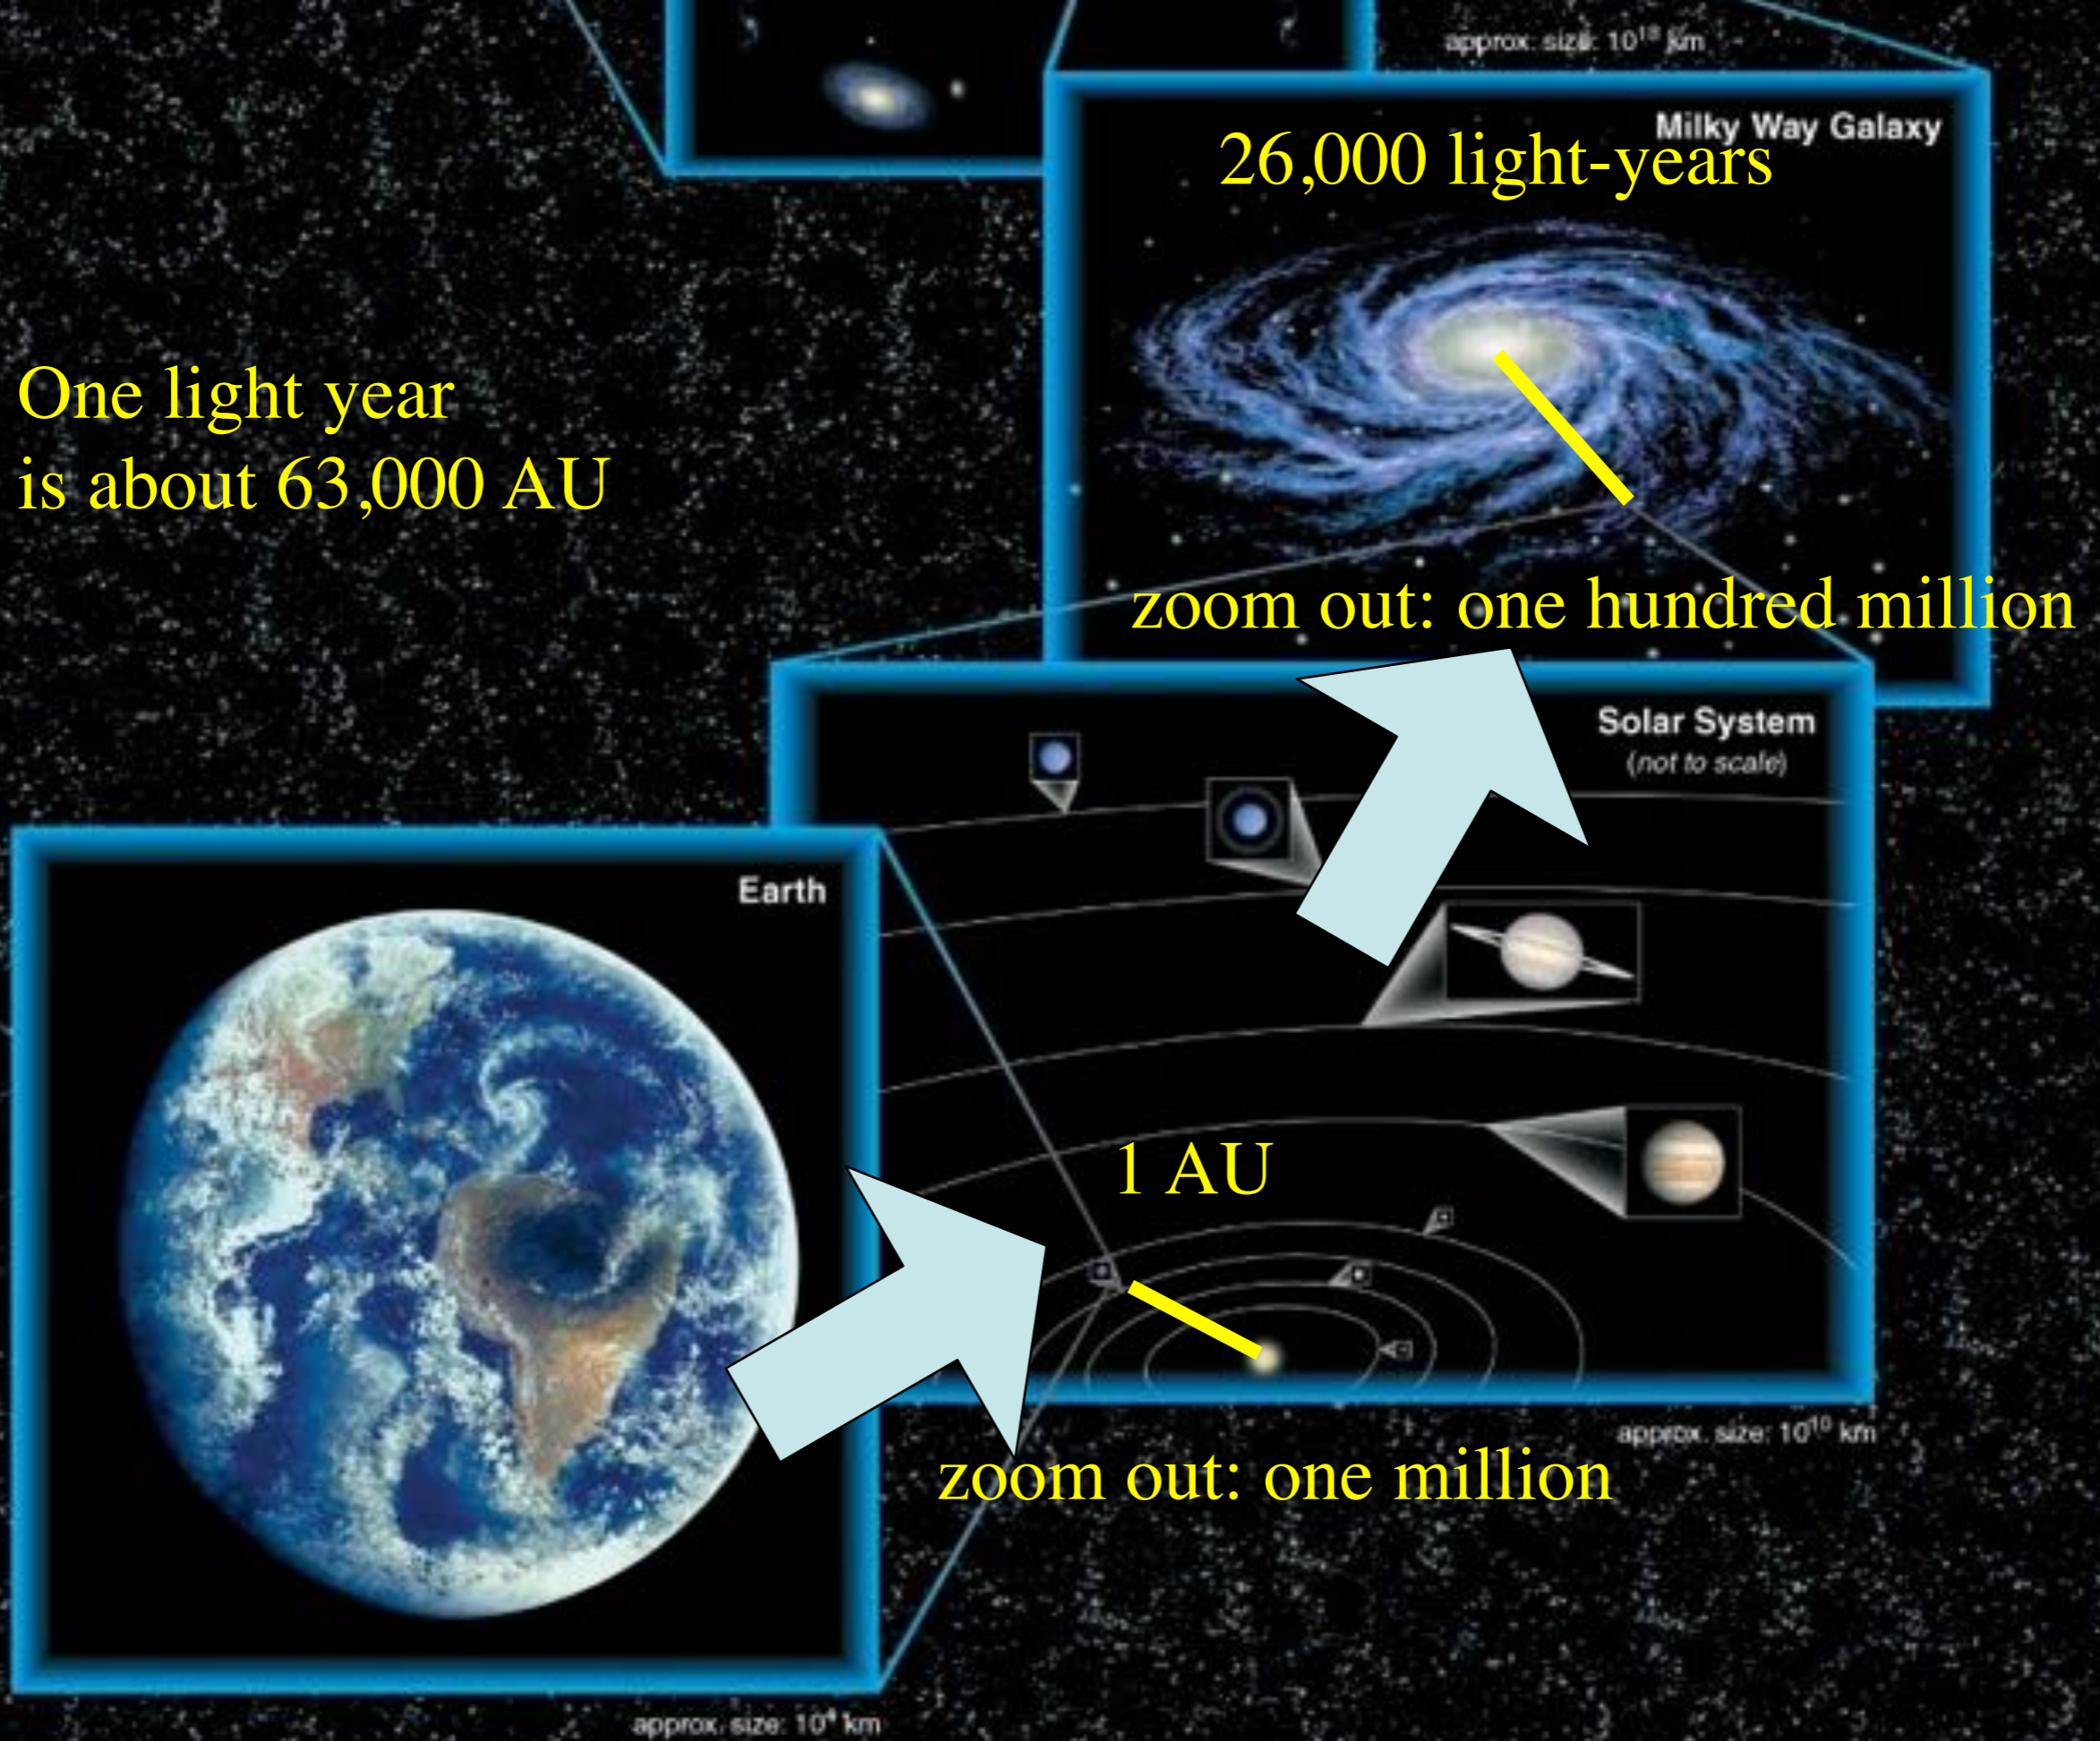

To same scale

Pluto  
40 AU

Smithsonian Institution on the National Mall in Washington, DC

One light year  
is about 63,000 AU

From the sun to the center of the Milky Way Galaxy is about 26,000 light-years

The difference from 28,000 light-years reflects the uncertainty in this measurement.

# Space is Huge; Time is Deep: The Universe is Ancient

- The Cosmic Calendar: A scale on which we compress the history of the universe into 1 year.

© 2007 Pearson Education, Inc., publishing as Addison-Wesley

The Universe is about 14 billion years old, so at this scale, 1 month represents a little more than 1 billion years.

# THE HISTORY OF THE UNIVERSE IN 1 YEAR

January 1:  
The Big Bang

February:  
The Milky Way forms

September 3:  
The Earth forms

September 22:  
Early life on earth

December 17:  
Cambrian explosion

December 26:  
Rise of the dinosaurs

December 30:  
Extinction of the dinosaurs

December 31:

9:00 pm:  
Early hominids evolve

11:58 pm:  
Modern humans evolve

25 seconds ago:  
Agriculture arises

11 seconds ago:  
Pyramids built

1 second ago:  
Kepler and Galileo  
show that Earth  
orbits the Sun

Now

# Astronomy covers astronomical scales:

- The Universe is MUCH larger than
    - Galaxies which are MUCH larger than
      - Stars which are MUCH larger than
        - Planets which are MUCH larger than
          - » Moons, comets, and asteroids, which are MUCH larger than
            - PEOPLE
- The Universe is incredibly ancient
  - but does have a finite age
    - the oldest stars are ~13 billion years old
    - the sun, earth, & solar system are 4.5 billion years old
    - new stars are still forming today

# The Scientific Method

## A few necessary ASSUMPTIONS:

- There exists an objective, knowable Reality
  - or at least an inter-subjective reality upon which independent observers can agree
- Reality is governed by physical processes that can be described by a set of rules
  - The “Laws of Nature”
- The Laws of Nature are accessible to human knowledge through experimentation
- The Laws of Nature are universal
  - The rules don’t change arbitrarily
  - God doesn’t cheat

## The idealized scientific method:

- Based on proposing and testing hypotheses

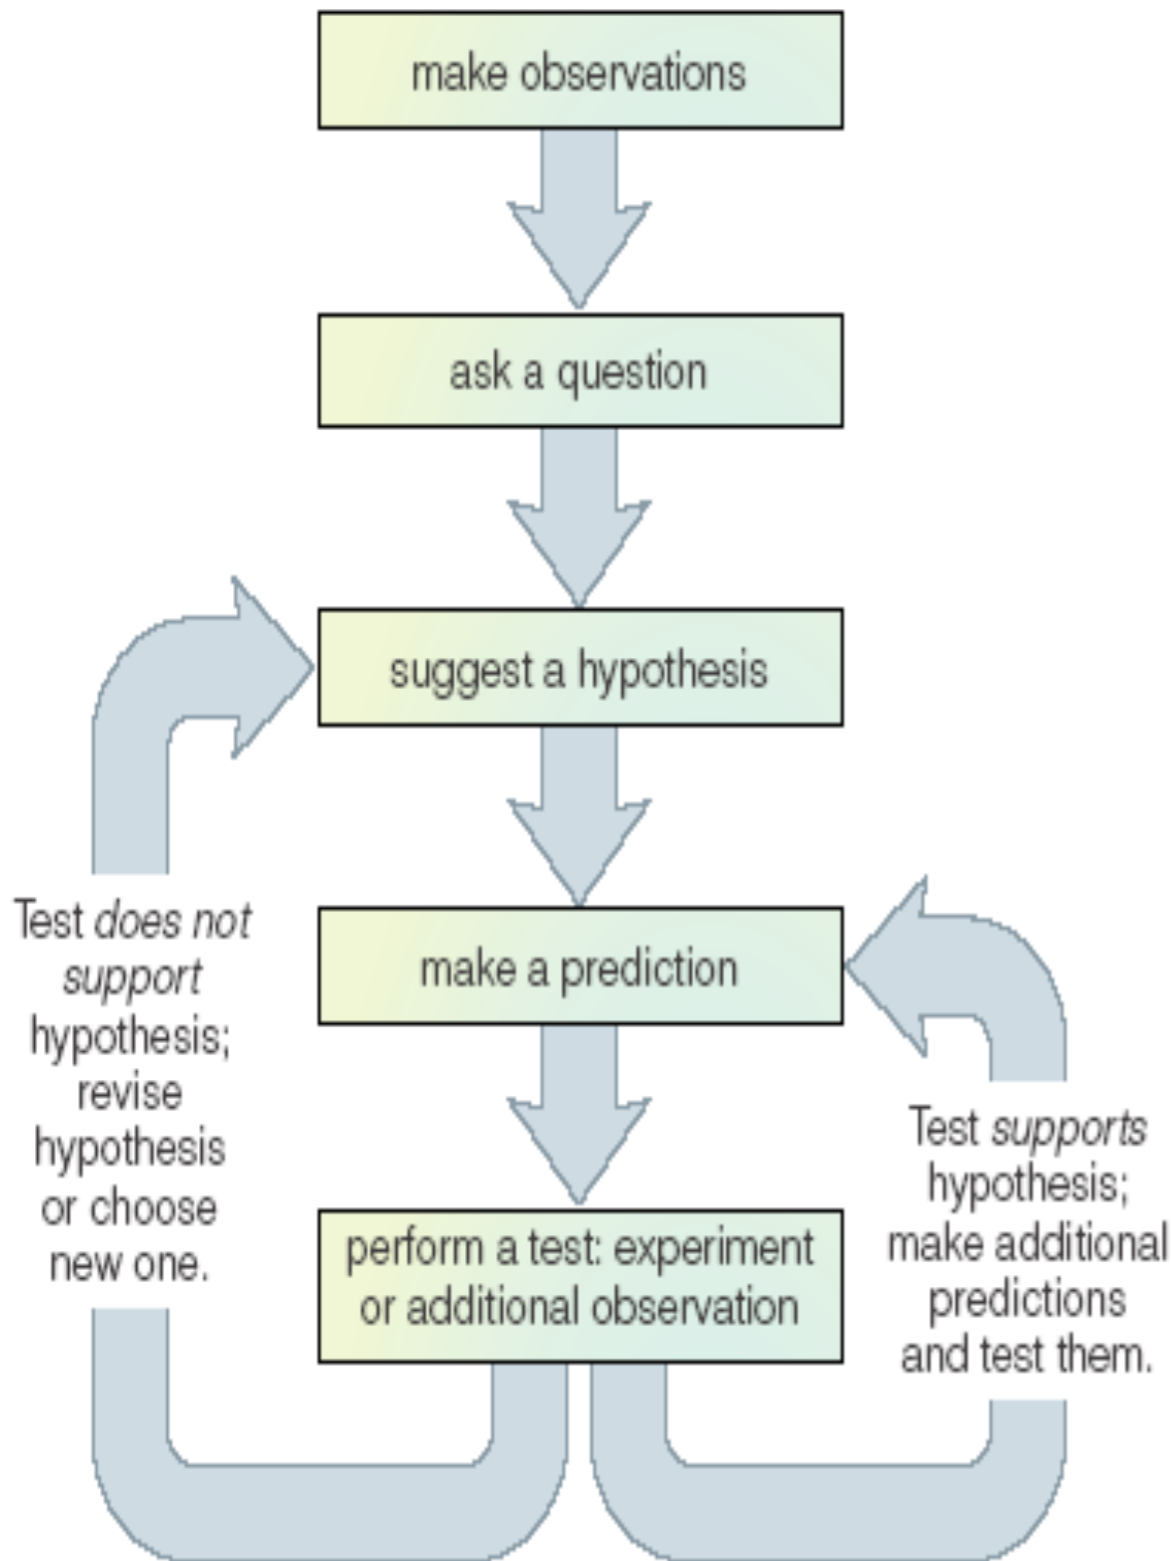

Facts are the results of observation or measurement.

A scientific hypothesis is an idea that leads to testable or falsifiable predictions.

A theory is a well-developed group of ideas that is tied to known physical laws and makes testable predictions.

Well-established theories (e.g., Darwin's theory of evolution, Einstein's theory of relativity) have passed many tests and are widely accepted

but theories remain subject to revision or rejection if they fail to explain new tests.

# *Hallmarks of Science: #1*

Modern science seeks explanations for observed phenomena that rely solely on natural causes.

(A scientific model cannot include divine intervention.)

No magic!

"I think you should be more explicit here in step two."

## *Hallmarks of Science: #2*

Science progresses through the creation and testing of models of nature that explain the observations as simply as possible.

This philosophy of simplicity is often called “Occam’s razor”

**“All things being equal, the simplest solution tends to be the best one.”**

**William of Ockham**

(1285 - 1347)

## *Hallmarks of Science: #3*

A scientific model must make testable predictions about natural phenomena that would force us to revise or abandon the model if the predictions do not agree with observations.

# The Principle of Doubt

- Hypotheses can be *rejected* but never completely *confirmed*.
- At best, a theory can be *adequate* for describing a specific set of phenomena.
- Do not trust - verify through experiment.
- Simple theories are preferable to complicated theories (Occam's Razor)
  - Any theory can be made complicated enough to explain anything
  - Elegance and Understanding better than Age and Authority
  - If a theory has its predictions come true, we are obliged to acknowledge its efficacy, even if it means rejecting something we formerly believed.

# Measurement Uncertainty

- No experiment is perfect
- Experimental uncertainty is often the difference between rejecting a hypothesis and an ambiguous result
- It is important to quantify both measurements **AND** their accuracy

e.g., Newton's constant:

$$G = (6.67428 \pm 0.00067) \times 10^{-11} \text{ m}^3 \text{ kg}^{-1} \text{ s}^{-2}. \quad (0.01\%)$$

the distance to the center of the Milky Way

$$R_0 = 26,000 \pm 2,000 \text{ light years} \quad (8\%)$$

# The Appearance of the Sky

## 2.1 Patterns in the Night Sky

### Our goals for learning:

- What does the universe look like from Earth?
- Why do stars rise and set?
- Why do the constellations we see depend on latitude and time of year?

# What does the universe look like from Earth?

With the naked eye, we can see more than 2,000 stars as well as the Milky Way.

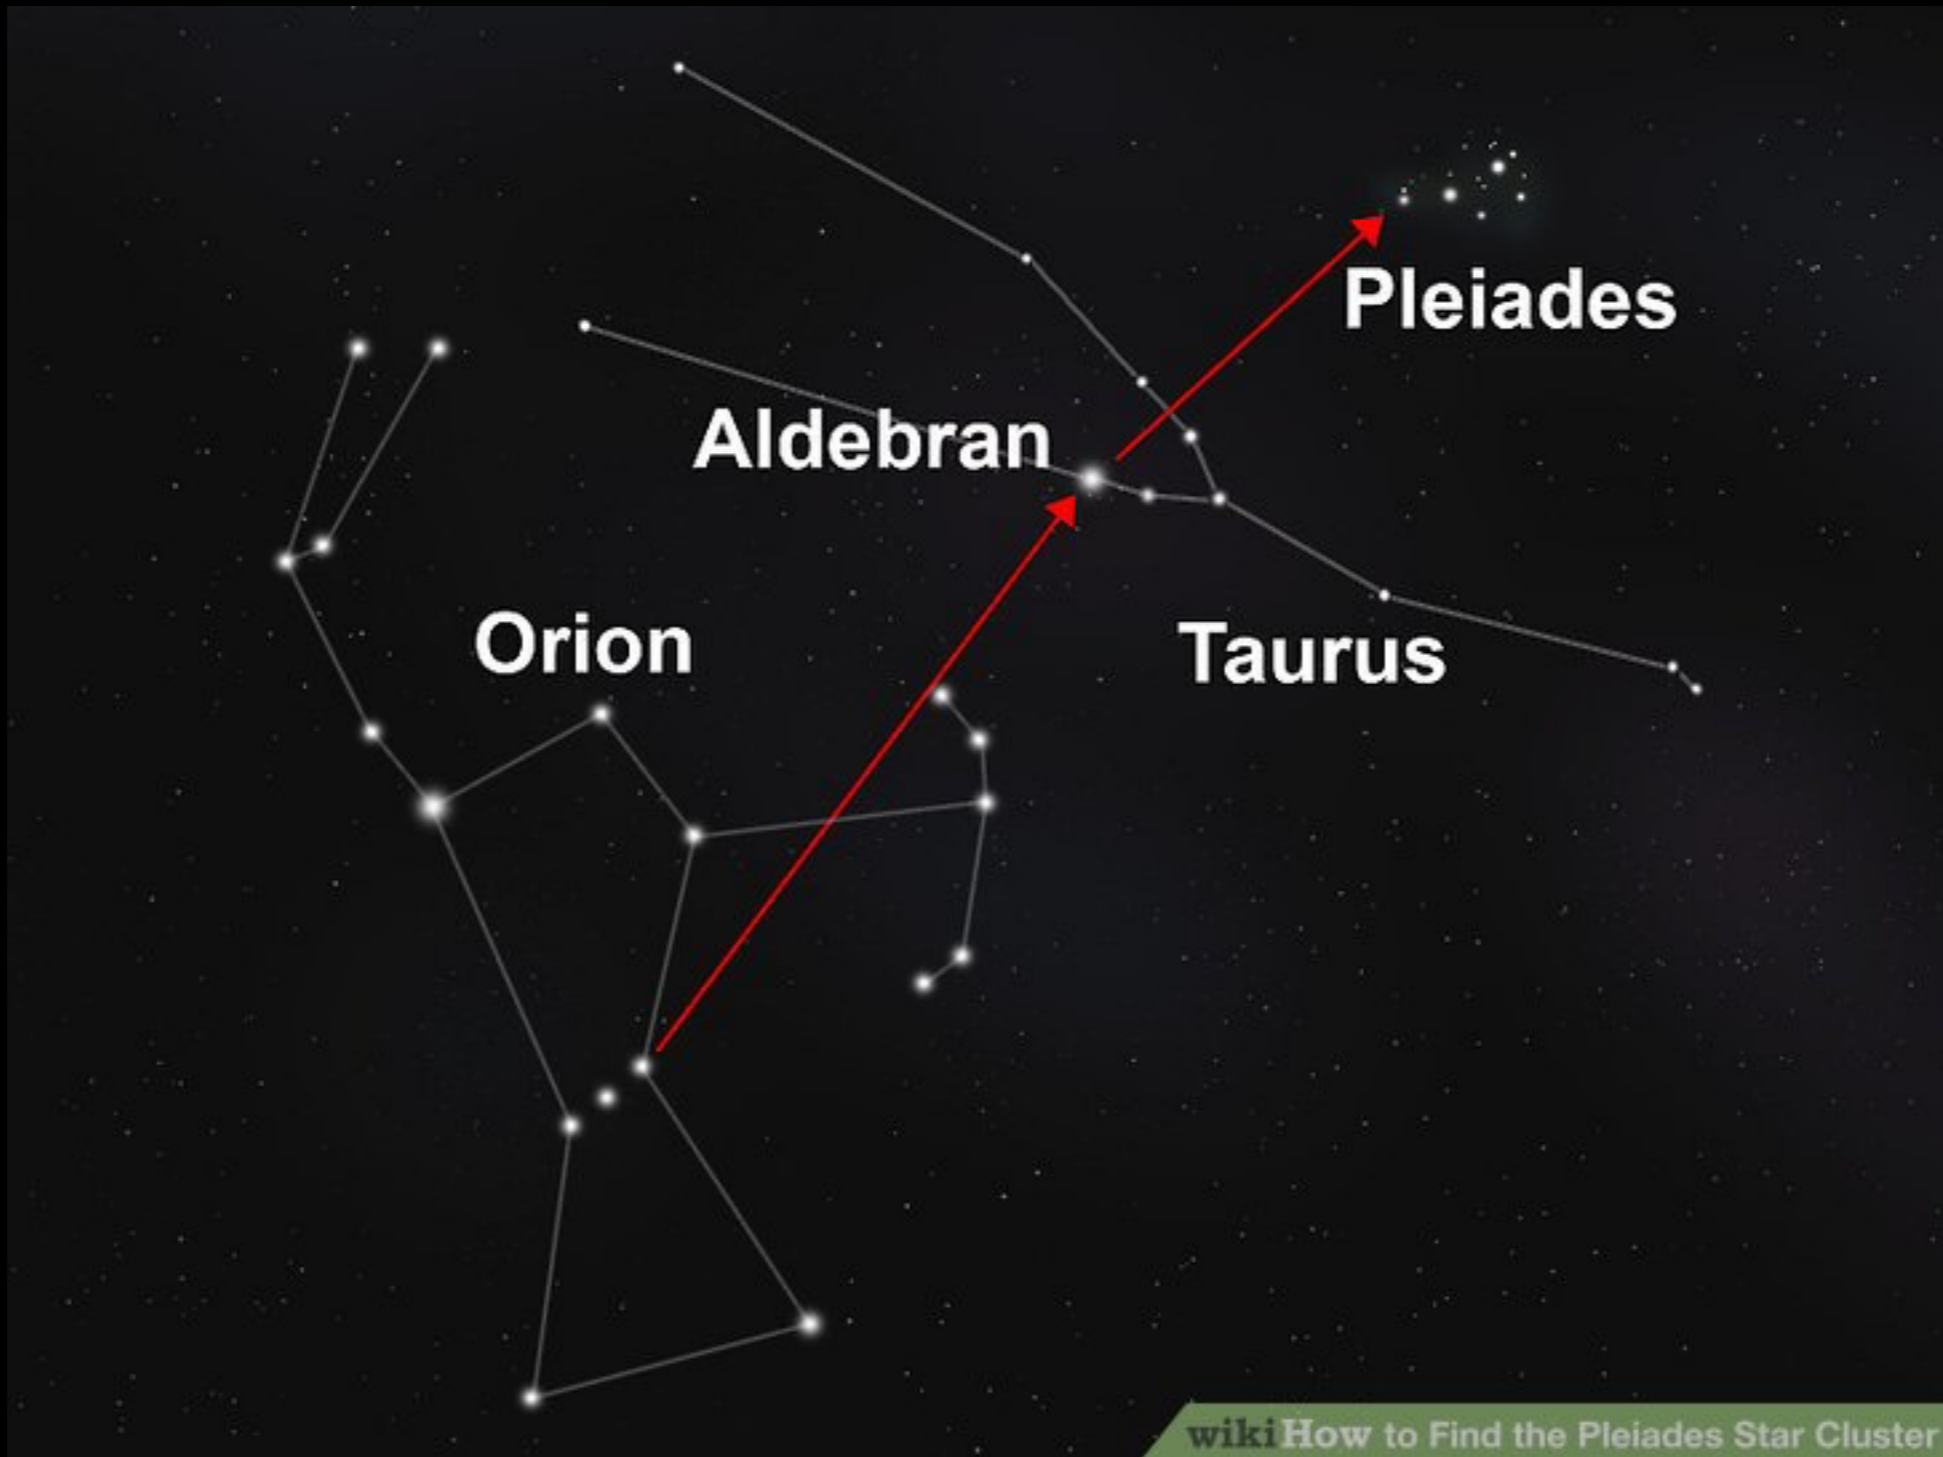

# Constellations

A constellation is a *region* of the sky.

88 constellations fill the entire sky.

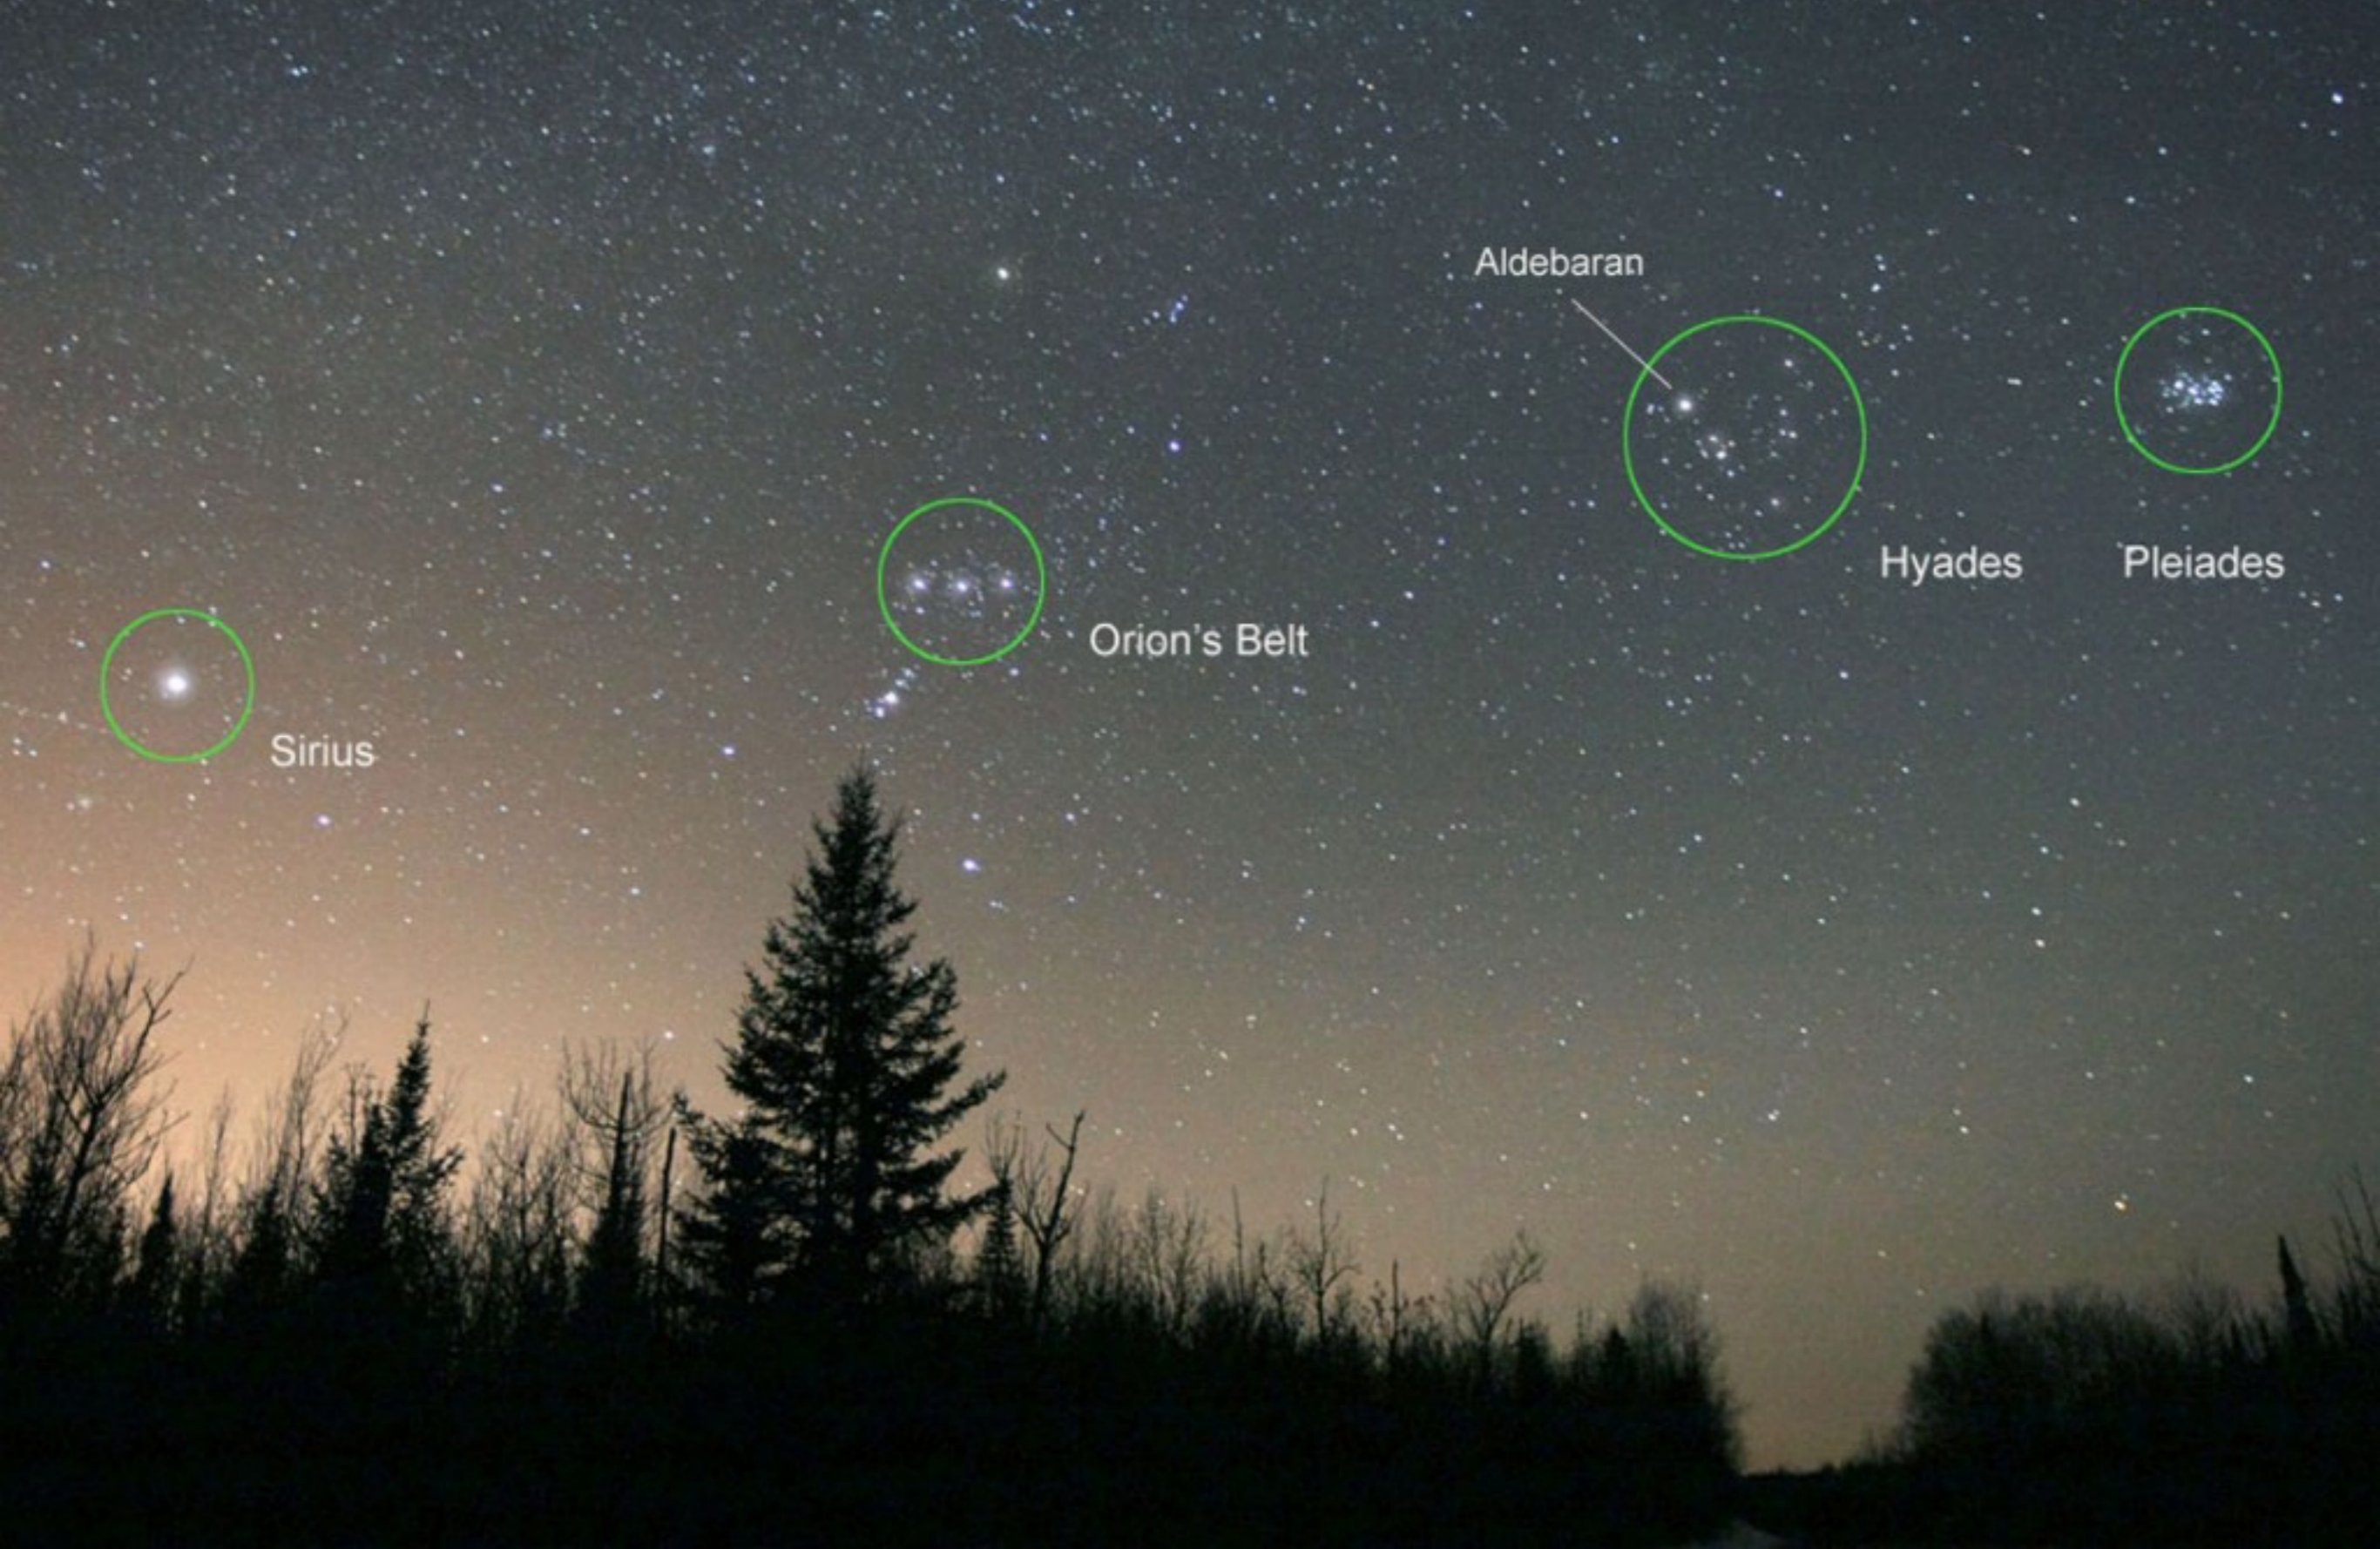

**Orion**

**Aldebran**

**Taurus**

**Pleiades**
