Interaction of Light with Matter

Thermal Radiation

Kirchhoff's Laws

THE ELECTRO MAGNETIC SPECTRUM

E, f increasing
 λ decreasing

Same stuff, different Energy:

- Radio
- microwave
- infrared
- visible light
- ultraviolet
- X-ray
- gamma ray

Ionizing
radiation

benign

potentially
dangerous

Energy per photon
increasing

How do light and matter interact?

- Emission
- Absorption
- Transmission:
 - Transparent objects transmit light.
 - Opaque objects block (absorb) light.
- Reflection or scattering
 - we see by scattered light

transmission & absorption

Earth's atmosphere is opaque to light at most wavelengths. It is transparent only to visible light and radio waves - and is only completely transparent to visible light when it isn't cloudy.

Reflection and Scattering

Mirror reflects light in a particular direction.

Movie screen scatters light in all directions.

We see by scattered light

Interactions between light and matter determine the appearance of everything around us.

optical

**optical photons
- scattered
ambient light**

infrared

**infrared photons
emitted
by warm object**

Temperature scale illustrated by false color

Production of light

Why do stars shine?

They're hot!

Thermal Radiation

- Hot, dense objects emit thermal radiation
 - includes stars, planets, and you.
- An object's thermal radiation spectrum depends on its **temperature**.

In general, heat flows from hot to cold until equilibrium is achieved. Thermal radiation is the least efficient mechanism for heat flow, but is the only one that works through the vacuum of space.

Properties of Thermal Radiation

1. Hotter objects emit more light at all frequencies per unit area.
2. Hotter objects emit photons with a higher average energy.

Wien's Law

- $\lambda_p T = 2.9 \times 10^6 \text{ nm K}$
- λ_p is the wavelength of maximum emission
(in nanometers nano = 10^{-9})
- T is temperature (in degrees Kelvin)

As T increases, wavelength decreases.

So hot object blue; cool objects red.

2 Examples:

- Human body

- T = 310 K

$$\lambda_p = \frac{2.9 \times 10^6 \text{ nm K}}{310 \text{ K}} = 10,000 \text{ nm}$$

- We radiate in the infrared

- The Sun

- T = 5,800 K

$$\lambda_p = \frac{2.9 \times 10^6 \text{ nm K}}{5800 \text{ K}} = 500 \text{ nm}$$

- The sun radiates visible light

Properties of Thermal Radiation

Hotter objects emit photons with a higher average energy.

Stefan-Boltzmann Law

$$L = 4\pi R^2 \sigma T^4$$

surface area
of a sphere

- **L** = Luminosity (power radiated)
- **R** = Radius (e.g., of a star)
- **T** = Temperature (of radiating surface, in K)
- **σ** = Stefan-Boltzmann constant
 - just a number to make units work right

$$L \propto R^2 T^4$$

The absolute brightness of a star depends on its size (**R**) and temperature (**T**).

Properties of Thermal Radiation

Hotter objects emit more light at all frequencies per unit area.

Total luminosity is the area under the curve

Inverse square law

- The intensity of light diminishes with the inverse square of the distance from the source

Inverse square law

- Just a geometrical effect
 - Light from a point source (e.g., a light bulb or a star) gets spread out in all directions.
 - diminishes by the surface area of the sphere it fills

apparent
brightness

$$b = \frac{L}{4\pi d^2}$$

How bright we perceive a star to be depends on both its intrinsic luminosity and its distance from us.

Three basic types of spectra

Spectra of astrophysical objects are usually combinations of these three basic types.

Kirchoff's Laws

- Hot, dense objects emit a
 - **continuous spectrum** e.g., a light bulb
 - light of all colors & wavelengths
 - follows thermal distribution
 - obeys Wien's & Steffan-Boltzmann Laws.
- Hot, diffuse gas emits light only at specific wavelengths.
 - **emission line spectrum** e.g., a neon light
- A cool gas obscuring a continuum source will absorb specific wavelengths
 - **absorption line spectrum** e.g., a star

Continuous Spectrum

- The spectrum of a common (incandescent) light bulb spans all visible wavelengths, without interruption.

Kirchoff's Laws

- Hot, dense objects emit a
 - **continuous spectrum** e.g., a light bulb
 - light of all colors & wavelengths
 - follows thermal distribution
 - obeys Wien's & Steffan-Boltzmann Laws.
- Hot, diffuse gas emits light only at specific wavelengths.
 - **emission line spectrum** e.g., a neon light
- A cool gas obscuring a continuum source will absorb specific wavelengths
 - **absorption line spectrum** e.g., a star

Emission Line Spectrum

- A thin or low-density cloud of gas emits light only at specific wavelengths that depend on its composition and temperature, producing a spectrum with bright emission lines.

Kirchoff's Laws

- Hot, dense objects emit a
 - **continuous spectrum** e.g., a light bulb
 - light of all colors & wavelengths
 - follows thermal distribution
 - obeys Wien's & Steffan-Boltzmann Laws.
- Hot, diffuse gas emits light only at specific wavelengths.
 - **emission line spectrum** e.g., a neon light
- A cool gas obscuring a continuum source will absorb specific wavelengths
 - **absorption line spectrum** e.g., a star

Absorption Line Spectrum

- A cloud of gas between us and a light bulb can absorb light of specific wavelengths, leaving dark absorption lines in the spectrum.

Kirchoff's Laws

- Hot, dense objects emit a
 - **continuous spectrum** e.g., a light bulb
 - light of all colors & wavelengths
 - follows thermal distribution
 - obeys Wien's & Steffan-Boltzmann Laws.
- Hot, diffuse gas emits light only at specific wavelengths.
 - **emission line spectrum** e.g., a neon light
- A cool gas obscuring a continuum source will absorb specific wavelengths
 - **absorption line spectrum** e.g., a star

How does light tell us what things are made of?

Spectrum of the Sun

Atomic Terminology

- **Atomic Number** = # of protons in nucleus
- **Atomic Mass Number** = # of protons + neutrons

Hydrogen (${}^1\text{H}$)

atomic number – 1
atomic mass number = 1
(1 electron)

Helium (${}^4\text{He}$)

atomic number – 2
atomic mass number = 4
(2 electrons)

Carbon (${}^{12}\text{C}$)

atomic number – 6
atomic mass number = 12
(6 electrons)

Atomic Terminology

- **Isotope:** same # of protons but different # of neutrons (^4He , ^3He)

Isotopes of Carbon

carbon-12

^{12}C

(6 protons
+ 6 neutrons)

carbon-13

^{13}C

(6 protons
+ 7 neutrons)

carbon-14

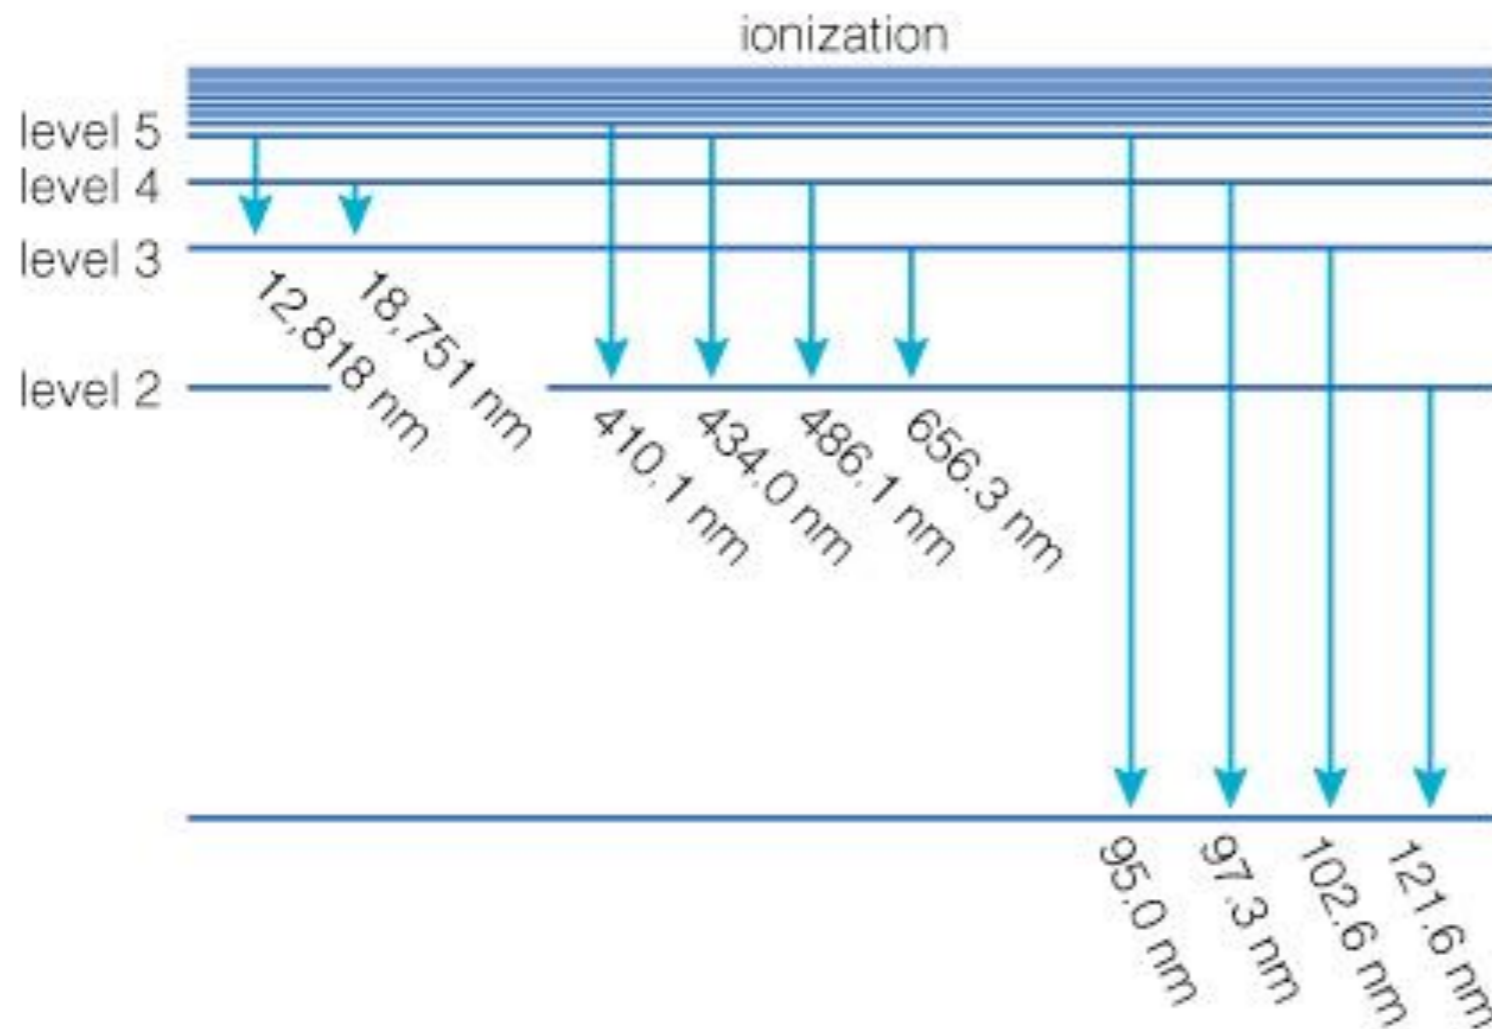

^{14}C

(6 protons
+ 8 neutrons)

- **Molecules:** consist of two or more atoms (H_2O , CO_2)

Chemical Fingerprints

Energy levels of hydrogen

- Each type of atom has a unique set of energy levels.
- Each transition corresponds to a unique photon energy, frequency, and wavelength.
